VLAN 5, 6

VLAN 5

Branch Locations

VLAN 5

Problem:

Ethernet networks are inherently unsecure and prone to man in the middle attacks as well as data sniffing/snooping.

Many companies need to encrypt only certain VLANs carrying regulated data.

Solution:

Using TrustNet Manager, you can secure any Layer 2 network without using delay-causing IPsec Tunnels.

TrustNet's Manager "per VLAN" encryption policy feature allows you to secure each VLAN with a unique policy and key.

Benefits:

Encryptors can be placed upstream or downstream from the router or switch.

Ability to cryptographically segment VLANs.

Supports variable link speeds from 3Mbps to 10Gbps.
