

Problem:

Embassies throughout the world connected via the Internet, public networks and private connections.

Most data security solutions can not protect data over public and private networks at the same time.

Solution:

Using TrustNet Manager's Virtual IP capability, security administrators can secure all branches and remote offices under a single group policy, without using IPsec tunnels.

Benefits:

Customers are able to encrypt data over public and private networks simultaneously with a single, easy to use solution.

No changes are required to the existing infrastructure.
